16-bit Single Chip Microcontroller

- Low power operation from 1.2V with a single alkaline or silver oxide button battery.
- Low power consumption standby driving at HALT 0.3 μA.
- *super economy mode
- Built-in LCD Driver: 50 SEG x 8 COM (max.) S1C17W14
- Built-in LCD Driver: 56 SEG x 8 COM (max.) S1C17W16

**DESCRIPTIONS**

The S1C17W14/W16 is a 16-bit MCU that features low-voltage operation from 1.2 V even though Flash memory is included. The embedded high-efficiency DC-DC converter generates the constant-voltage to drive the IC with lower power consumption than 4-bit MCUs. This IC includes a real-time clock, a stopwatch, an LCD driver, and a PWM timer capable of being used to generate drive waveforms for a motor driver as well as a high-performance 16-bit CPU. It is suitable for battery-driven applications that require an LCD display and timers.

</table>
| Supply voltage detector (SVD)             | - Detection level: 30 levels (1.2 to 3.6 V)  
- Detection accuracy: ±3%  
- Intermittent operation mode: Generates an interrupt and reset according to the detection level evaluation.                                                                                                         |
| Serial interfaces                         | - UART (UART): 2 channels, Baud-rate generator included, IrDA1.0 supported  
- Synchronous Serial Interface (SPIA): 2 to 16-bit variable data length, The 16-bit timer (T16) can be used for the baud-rate generator in master mode.                                                                                   |
| Sound generator (SNDA)                    | - Buzzer output function: 512 Hz to 16 kHz output frequencies  
- Melody generation function: Pitch: 128 Hz to 16 kHz ≈ C3 to C6, Duration: 7 notes/rests (Half note/rest to thirty-second note/rest), Tempo: 16 tempos (30 to 480), Tie/Slur may be specified.                          |
| IR remote controller (REMC2)              | - Number of transmitter channels: 1 channel  
- Baud-rate generator included  
- LCD output: 50 SEG × 5–8 COM (max.), 54 SEG × 1–4 COM (max.), 56 SEG × 5–8 COM (max.), 60 SEG × 1–4 COM (max.)  
- LCD contrast: 16 levels  
- Other: 1/3 bias power supply included, external voltage can be applied.                                                                                                                                    |
| Multiplier/divider (COPRO2)               | - 16-bit × 16-bit multiplier  
- 16-bit × 16-bit + 32-bit multiply and accumulation unit  
- 32-bit + 32-bit divider                                                                                                                                                                               |
| Reset                                     | - #RESET pin: Reset when the reset pin is set to low.  
- Power-on reset: Reset at power on.  
- Key entry reset: Reset when the P00 to P01/P02/P03 keys are pressed simultaneously (can be enabled/disabled using a register).  
- Watchdog timer reset: Reset when the watchdog timer overflows (can be enabled/disabled using a register).  
- Supply voltage detector reset: Reset when the supply voltage detector detects the set voltage level (can be enabled/disabled using a register).                                                                 |
| Interrupt                                 | - Non-maskable interrupt: 4 systems (Reset, address misaligned interrupt, debug, NMI)  
- Programmable interrupt: External interrupt: 1 system (8 levels), Internal interrupt: 18 systems (8 levels), Internal interrupt: 23 systems (8 levels)                                                                 |
| Other                                     | - 12-bit A/D converter (ADC12A)  
- Conversion method: Successive approximation type  
- Resolution: 12 bits  
- Number of conversion channels: 1 channel  
- Number of analog signal inputs: 4 ports/channel  
- Supported sensors: DC-bias resistive sensors, AC-bias resistive sensors  
- Supported sensors (Ch.0 only): DC-bias resistive sensors, AC-bias resistive sensors  
- Number of conversion channels: 2 channels (Up to two sensors can be connected to each channel.)  
- Number of conversion channels (Up to two sensors can be connected.)  
- Conversion method: CR oscillation type with 24-bit counters

## Pin Descriptions

### Symbol meanings

**Assigned signal:** The signal listed at the top of each pin is assigned in the initial state. The pin function must be switched via software to assign another signal (see the "I/O Ports" chapter).

**I/O:**
- **I** = Input
- **O** = Output
- **I/O** = Input/output
- **P** = Power supply
- **A** = Analog signal
- **Hi-Z** = High impedance state

**Initial state:**
- **I (Pull-up)** = Input with pulled up
- **I (Pull-down)** = Input with pulled down
- **Hi-Z** = High impedance state
- **O (H)** = High level output
- **O (L)** = Low level output

**Tolerant fail-safe structure:**
- ✓ = Over voltage tolerant fail-safe type I/O cell included (see the “I/O Ports” chapter)

Notes: In the peripheral circuit descriptions, the assigned signal name is used as the pin name.
Universal port multiplexer (UPMUX)

The universal port multiplexer (UPMUX) allows software to select the peripheral circuit input/output function to be assigned to each pin from those listed below.

<table>
<thead>
<tr>
<th>Peripheral circuit</th>
<th>Signal to be assigned</th>
<th>I/O</th>
<th>Channel number n</th>
<th>Function</th>
</tr>
